## M.Phil. - PHYSICS

The Master of Philosophy (M Phil) in Physics is a full time course for one year after completion of M Sc in Physics. Admission to M.Phil. (Physics) programme will be done through entrance examination.

The course structure will contain three Theory Papers and Dissertation, Three Seminars and Two internal examinations/assessments as outlined below.

Name of the Paper	Marks
1. Research Methodology, Quantitative Methods and Computer Applications	100
2. Physics of Advance Materials	100
3. Astronomy & Astrophysics	100
Dissertation & Seminar	200
Total Marks	500

### Distribution of marks of Dissertation and seminar

- (i) Seminar (best two out of three) : 50 marks
- (ii) Dissertation : 150 marks
  - (a) Final Seminar based on dissertation : 50
  - (b) Dissertation (script) evaluation : 75
  - (c) Viva-voce : 25

**Paper – I**  
**Research Methodology, Quantitative Methods and Computer Applications**

**UNIT- I**

**Techniques for Structural, Microscopic, and Spectroscopic Characterization**

X-ray diffraction: coherent scattering of X-rays, reflected intensities, experimental methods of crystallography, particle size determination.

Microscopy: Scanning Electron Microscopy (SEM), Transmission Electron Microscopy (TEM), Scanning Transmission Electron Microscopy (STEM), Scanning Tunneling Microscopy (STM), Atomic Force Microscopy (AFM).

Spectroscopy: Fourier Transform Infrared (FTIR) and Raman spectroscopy, Nuclear Magnetic Resonance (NMR), Electron Spin Resonance (ESR).

**UNIT – II**

**Techniques for Characterization of Solid State Ionic Materials**

Solid State Ionic Materials: Characterization of ion transport properties; AC Impedance Spectroscopy (IS) for conductivity of ( $\sigma$ ) measurements; DC polarization methods viz, Tubandt's method, Wagner's method, Transient Ionic Current (TIC) method for ionic mobility ( $\mu$ ), ionic transference number ( $t_{ion}$ ), mobile ion concentration ( $n$ ) and ionic drift velocity ( $v_d$ ) measurements. Temperature dependent studies on  $\sigma$ ,  $\mu$ ,  $n$ ,  $v_d$  etc. and computation of respective energies.

Thermal analysis: Differential Thermal Analysis (DTA), Differential Scanning Calorimetry (DSC), Thermal Gravimetric Analysis (TGA).

**UNIT-III**

**Luminescence Techniques**

Basic mechanisms of Photoluminescence (PL) :- Excitation & Emission spectra, radiative & non-radiative transition, up & down conversion, Multiphonon and cross relaxation, Crystal field splitting, Energy transfer processes, Measurement techniques to study Photoluminescence response, Techniques for ML measurement, TL measurement techniques- Basic TL apparatus, Heating system, Light detection, recording and display, TL glow curve, UV-visible spectrometry.

**UNIT – IV**

**Astronomical Techniques**

Photometry: Instrumental magnitudes and colors, seeing and atmospheric effects, extinction correction. Standard photometric systems: UBV and other systems. Transformation to standard photometric systems. Absolute and differential photometry.

Spectroscopy: Basics of prism and grating spectroscopes.

Basics of CCD data reduction: Plate scale, readout noise and gain, signal-to-noise ratio. correction for bias, dark and flat fielding, fringing and cosmetic effects.

**UNIT –V**

**(I) Programming in C**

Position of C Language, A comparison of learning English Language and C Language, C Instructions: Type declaration instruction, Arithmetic instruction; Reasons of language C getting popular, Tokens: Keywords, Identifiers, Variable, Integer Variables, Character Variables, Float Variables; Data Types: A logical Statements; Important statements regularly used.

**Control Structures: The Decision Control Structures** If Statement, If-else Statement, Use of Logical Operators, The Conditional Operators. **The Loop Control Structure:** Loops, the while Loop, the for Loop, the Odd Loop, the break Statement, the Continue Statement, the do-while

Loop. **The Case Control Structure:** Decisions Using switch, switch Versus if-else Ladder The go to Keyword.

**Recommended Text and Reference books:**

1. Characterization of Materials: Wachtman J B (Butterworth-Heinemann)
2. Condensed Matter Physics by Michal P. Marder (Willy Inter. Science Pub., 2000)
3. Superionic Solids- Principle and applications by S. Chandra (NH Pub., 1980)
4. Luminescence of Solids : R Vij (Plenum Press)
5. Digital Image processing: Gonzalez R. C. and Woods R. E. (Addision-Wesley)
6. Astronomical Photometry: Henden A. A. and Kaitchuck R H (Willmann-Bell)
7. Astrophysical techniques: Kitchin C R , third edition (IOP publishing)
8. Optical Astronomical Spectroscopy: Kitchin C R (IOP Publishing).
9. Let us C by Yaswant Kanitkar
10. C Programming by Dennis Riche and Brian Karnighan
11. C Programming by Schauam Series
12. Physics through C-programming by S. Palaniswamy

**Paper II**  
**Physics of Advance Materials**

**Unit I**  
**Nano Particles and Nano Structured Materials**

Properties of Individual Nano-Particle: metal nano clusters, theoretical modeling of nanoparticles, geometric and electronic structure, magnetic clusters, Semiconductor nanoparticles, optical properties, rare gas and molecular clusters, methods of synthesis of nano particles, Carbon nanostructure, C<sub>60</sub> carbon cluster, carbon nanotube and applications. Bulk nano structured materials: Solid disordered nanostructures, methods of synthesis, properties, metal nano-cluster composite glasses, porous silicon; Nano structured crystals.

**Unit II**  
**Quantum Nanostructures and Nano- Machines/ Devices**

Quantum wells, wires and dots, preparation, size & dimensionality effects, excitons, single electron tunneling, applications of quantum nanostructures, Super conductivity, Self assembly, process of self assembly, semiconductor islands, monolayers, Catalysis, surface area of nanoparticles, porous, and colloidal materials, Nanomachines and nano devices; microelectromechanical systems (MEMSs), nanoelectromechanical systems (NEMs).

**UNIT III**  
**Solid State Ionic Materials**

Bonding types in solids, formation of ionic bond, simple theory of ionic structures; Super ionic materials and structures, alkali ion conductors,  $\beta$ - aluminas, silver ion conductors, copper ion conductors, structural principles for fast Ag<sup>+</sup> & Cu<sup>+</sup> ion conductors, oxygen and halide ion conductors, proton conductors, electronic conductors with ion transport, broad classification of super ionic conductors: polycrystalline/ crystalline, glass/ amorphous, composite, polymeric electrolytes, Mechanism of ion conduction in solid state ionic materials theoretical models. Applications of super ionic solids: sensors and partial pressure gauges, fuel cells, solid state batteries, coulometer-timers, electrochemical capacitors, electro chromic display devices etc.

**UNIT IV**  
**Luminescence of solids**

Introduction, characteristics of luminescence, Luminescence power, Luminescence spectrum, excitation spectrum, Luminescence Rise and Decay. Thermo luminescence - models: Jablonski model, Configuration-coordination model, energy band model, thermoluminescence mechanisms, Method of analysis; methods using different rates, half width method, initial rise method, Applications of thermoluminescence in radiation dosimetry and dating.

Mechanoluminescence: Mechanoluminescent materials, Characteristics, mechanisms, theories of Mechanoluminescence, applications.  
Lyoluminescence, LL reader, Inorganic lyoluminescence phosphors, mechanisms, enhancements and spectra.

## **UNIT V**

### **Electro-Optic Materials**

Electronic transitions-absorption and excitations, trapping and capture, recombination, radiative and non radiative recombination's, emission spectra, luminescence efficiency, light emitting diodes, LED configuration & performances, Solar radiation & ideal conversion efficiency, p-n junction solar cells, spectral response, I-V characteristics, heterojunction and thin film solar cells.

General mechanisms of photoconductivity processes, life time, photo-sensitivity, capture cross sections; recombination kinetics in absence of trapping; demarcation between trapping levels & recombination levels, effects of trapping.

- [1] **Introduction to Nanotechnology** by Charles P. Poole Jr. and Frank J. Owens (Wiley Inter. Science Pub. 2003).
- [2] **Condensed Matter Physics** by Michal P. Marder (Willy Inter. Science Pub., 2000)
- [3] **Nanostructures and Nanomaterials- Synthesis properties and Applications** by Guozhong Cao (Empirical College Press World Scientific Pub., 2004).
- [4] **Superionic Solids- Principle and applications** by S. Chandra (NH Pub., 1980).
- [5] **Superionic Solids and Solid Electrolytes- Recent Trends** by A.L. Laskar & S. Chandra (Eds.) (Academic Press, 1989).
- [6] **Physics of Semiconductor devices** by S.M.Sze (Wiley Int., 1981).
- [7] **Photoconductivity of Solids** by R.H.Bube (Wiley Int., 1967).
- [8] **Luminescence of Solids:** R Vij (Plenum Press)

## **PAPER – III ASTRONOMY & ASTROPHYSICS**

### **UNIT – I Stellar Physics**

Time and Coordinate system: Celestial Sphere, Solar Time, Sidereal Time, Julian Date, Right Ascension and Declination, Azimuth and Elevation, Magnitude, Luminosity and Stellar Distances.

A review of formation, structure and evolution of stars, final stages of stellar evolution of stars: white dwarfs, neutron stars and black holes.

Binary stars: close binary systems and their evolution; algols, cataclysmic variables, and x-ray binaries, Supernovae: Types, Characteristics and Energetics, Pulsars: Models and Energetic, Binary pulsars.

### **UNIT – II Radiative processes**

Synchrotron Radiation: Total emitted power, Spectrum of synchrotron radiation, Spectral index for Power law electron distribution, Spectrum and Polarization of synchrotron radiation, Transition from cyclotron to synchrotron emission, Distinction between received and emitted power, Synchrotron self absorption.

Compton scattering: Thomson scattering, Cross section and Energy transfer, Inverse Compton scattering, power and spectrum from single Compton scattering, multiple Compton scattering.

### **UNIT -III Inter-Stellar Matter(ISM)**

Inter-Stellar Matter (ISM) : an overview of evidence of matter between stars, distribution of dust and gas in the Galaxy, methods of detection of dust and gas.

Interstellar dust: dust extinction and reddening, properties of the dust grains, diffuse interstellar absorption bands. Neutral interstellar gas : atomic interstellar absorption lines, 21cm line of HI, HI clouds, interstellar molecular lines and Molecular clouds. Ionized gas : HII regions, Planetary nebulae, supernova remnants and hot interstellar gas.

### **UNIT – IV Surface Photometry of Galaxies**

A review of morphological classification of galaxies, surface photometry of galaxies: Isophotes and ellipse fitting procedure, surface brightness profiles and geometrical profiles, color profiles. Photometry of elliptical galaxies: de Vaucouleurs law and other fitting functions and characteristics parameters. Isophote shapes: deviation from elliptical shapes, boxy and disk isophotes, faint features (dust, stellar disk shells etc) in elliptical galaxies. Correlations among global parameters and scaling laws: Faber-Jackson relation, the Fundamental plane and its interpretation.

## **UNIT – V**

### **Active Galactic Nuclei (AGN)**

Taxonomy of AGNs: Seyfert galaxies, Quasars, Radio galaxies, LINERS, BL Lac Objects and OVV's, Narrow line X-ray galaxies.

Black hole paradigm: mass of central object, fueling quasars, accretion disk structure.

Continuum emission: UV-optical continuum, infrared continuum, radio continuum and compact radio sources, superluminal motion.

The broad-line region (BLR): broad-line spectra, basic parameters, photoionization of the BLR, line profiles.

The narrow-line region: narrow-line spectra, physical conditions in low density gases, basic parameters, line profiles, Unified models of AGNs.
